

Beyond the Code

Three AI Products I Built at Universal Processing

Carlin Hou

Software Engineering Intern
Universal Processing

\$ whoami

Business + information systems background

**I connect user needs,
business workflows, and
engineering.**

How I Move Work Forward

// stay aligned

Context first. Decisions second. Then I build.

Lewis (CTO) 1:1 + weekly Taiwan engineering and PM sync.

START

`sync()`

Align

Taiwan updates · Jira · priorities

FOCUS

`build()`

Build

Product decisions · architecture · code · demos

FINISH

`verify()`

Verify

QA · code review · documentation · feedback

— **Context → decision → build → feedback.**

From Business Problem to Working Product

// product loop

Who does the work?	Where does it stall?	What can go wrong?

— Clear structure keeps AI focused on the right product.

Three Problems. Three AI Products.

01

AI Review Manager

IN TESTING

Manage multi-merchant reviews and route sensitive replies for approval.

02

AI Technical Support

IN TESTING

Answer from trusted company documents and hand off uncertain cases.

03

AI Salon Booking

WORKING END TO END

Match services, staff, resources, and live availability in one booking.

 Built around real team and merchant workflows.

AI Review Manager

★ GBP Reply Manager

Manage reviews

How is any business doing on Google?

Search a business to see its Google rating and a clearly labeled snapshot of recent public reviews. Free, no sign-in.

Manage your reviews

Search

Suggestions update as you type.

Faster replies without risking each merchant's voice.

- PROBLEM** Marketing manages Google and Yelp reviews across many accounts, but every merchant has a different voice.
- I BUILT** One dashboard, merchant-specific AI drafts, and approval for sensitive replies.
- RESULT** Working in testing; Marketing feedback is shaping the release.

AI Technical Support

24/7 first help, grounded in company knowledge.

PROBLEM Payment issues happen anytime, but useful answers are scattered across documents.

I BUILT Trusted-document retrieval, clarification, and a clear human handoff.

RESULT Working in testing; phone and CRM integration come next.

A screenshot of a web interface for merchant verification. At the top center is a logo consisting of a green upward arrow and a blue 'P'. Below the logo, the text 'Merchant verification' is displayed in bold. Underneath, a message reads: 'Please enter your merchant ID to start a support chat. You can find it on your processing statement.' There are two input fields: a large, rounded rectangular field with a blue border containing the text 'Merchant ID', and a smaller, solid blue rounded rectangular button to its right containing the text 'Verify' in white.

AI Salon Booking

One system coordinates the entire appointment.

CUSTOMER

"I need a gel manicure with nail art this Saturday afternoon."

I BUILT

Booking rules, matching, live availability, customer chat, and owner admin.

STATUS

Working end to end; merchant validation is next.

Working end-to-end product · merchant validation next

From natural request to confirmed booking.

How AI Changed the Way I Work

— Less time writing every line. More time owning the product.

The Hard Part Is Deciding What AI Should Control

AI Review Manager

People approve reputational risk.

AI Technical Support

Trusted documents first; humans take uncertain cases.

AI Salon Booking

System rules control real availability.

— AI can produce code. I own the product decisions and the result.

I turn messy workflows into AI products people can trust.

I'm ready to keep building what comes next.

With thanks to Taipei City, Universal Processing, the engineers, coworkers, and interns who shaped this summer.

Thank you.
